AME 60634 Int. Heat Trans. Free Convection: Overview

- Free Convection (or Natural Convection)
 - fluid motion induced by buoyancy forces
 - buoyancy forces arise when there are density gradients in a fluid and a body force proportional to density arises

AME 60634 Int. Heat Trans. Free Convection: Overview

- Internal vs. External
 - free convection can be generated in a duct or enclosure (internal)
 - along a free surface (external)
 - in both internal & external cases, free convection can *interact* with *forced convection (mixed convection)*
- Free Boundary Flow
 - occurs in an extensive quiescent fluid (*i.e.*, infinite, motionless fluid)
 - no forced convection
 - − induces a **boundary layer** on a heated or cooled surface $(T_s \neq T_{\infty})$
 - can generate plumes and buoyant jets

Int. Heat Trans. Free Convection: Dimensionless Parameters

Pertinent Dimensionless Parameters

Grashoff Number

 $Gr_L = \frac{g\beta(T_s - T_{\infty})L^3}{v^2} \sim \frac{\text{buoyancy force}}{\text{viscous force}} \xrightarrow{\text{As Grashoff # increases: buoyancy}}_{\text{overcomes friction and induces flow}}$

 $v = \frac{\mu}{\rho}$ = kinematic viscosity of fluid L = characteristic length

g = gravitational constant

 $\beta =$ thermal expansion coefficient (fluid property) $\longrightarrow \beta = -\frac{1}{\rho} \left(\frac{\partial \rho}{\partial T} \right)$ [K⁻¹]

Recall Reynolds number

 $\operatorname{Re}_{L} = \frac{VL}{V} \sim \frac{\text{inertial force}}{\text{viscous force}}$

Gr is analogous to Re

Rayleigh Number

$$Ra_L = Gr_L \Pr = \frac{g\beta(T_s - T_\infty)L^3}{v\alpha}$$

comparable to Peclet number (Pe) for forced convection

AME 60634 Int. Heat Trans. Free Convection: Mixed Convection

Mixed Convection

 a condition where both free and forced convection effects are comparable

• free convection can assist, oppose, or act orthogonally to forced convection

When is mixed convection **significant**?

 an assessment of scales is conducted through a comparison of free and forced non-dimensional parameters

 $\frac{\text{buoyancy force}}{\text{inertial force}} \sim \frac{Gr_L}{\text{Re}_L^2} \begin{cases} >>1 & \longrightarrow \text{ free convection dominates } Nu_L = f(Gr_L, \text{Pr}) \\ O(1) & \longrightarrow \text{ mixed convection condition } Nu_L = f(\text{Re}_L, Gr_L, \text{Pr}) \\ <<1 & \longrightarrow \text{ forced convection dominates } Nu_L = f(\text{Re}_L, \text{Pr}) \end{cases}$

Affect on heat transfer

forced and free convection DO NOT combine linearly

$$Nu_L^n = Nu_{L,forced}^n \pm Nu_{L,free}^n \rightarrow \begin{cases} n = 3 \text{ assisting/opposing} \\ n = \frac{7}{2} \text{ or } 4 \text{ transverse} \end{cases}$$

- + → assisting/transverse
 → opposing

AME 60634

Int. Heat Trans. Free Convection: Boundary Layers

Transition to Turbulence •

- similar to forced flows, free convection flows can transition from a laminar state to a turbulent state – *hydrodynamic instabilities*
- in forced convection, the transition is dependent on inertial and viscous forces
- in free convection, amplification of disturbances depends on relative magnitude of buoyancy and viscous forces

Critical Rayleigh Number

$$Ra_{x,c} \approx 10^9$$
 vertical flat plate

$$T_s > T_{\infty}$$

Quiescent
fluid, T_{∞}
Turbulent
 x_c
Laminar

• Only empirical relations exist for most "real" geometries

$$\overline{Nu}_L = \frac{hL}{k} = CRa_L^n$$

- Immersed Vertical Plate
 - average Nusselt numbers
 - Churchill & Chu correlation: laminar flow (Ra_L<10⁹)

$$\overline{Nu}_{L} = 0.68 + \frac{0.670 Ra_{L}^{\frac{1}{4}}}{\left(1 + \left(0.492/Pr\right)^{\frac{9}{16}}\right)^{\frac{4}{9}}}$$

- Churchill & Chu correlation: all flow regimes

$$\overline{Nu}_{L} = \left[0.825 + \frac{0.387Ra_{L}^{\frac{1}{6}}}{\left(1 + \left(0.492/\Pr\right)^{\frac{9}{16}}\right)^{\frac{8}{27}}}\right]^{2}$$

Inclined & Horizontal Plates

- buoyancy force is not parallel to plate
 - horizontal: perpendicular buoyancy force
 - inclined: angled buoyancy force
- flow and heat transfer depend on
 - thermal condition of plate: heated or cooled
 - orientation: facing upward or downward

Horizontal Plates

Correlation: heated/horizontal/facing up AND cooled/horizontal/facing down

Correlation: heated/horizontal/facing down AND cooled/horizontal/ facing up

$$\overline{Nu}_L = 0.27 Ra_L^{\frac{1}{4}} \rightarrow 10^5 \le Ra_L \le 10^{10}$$

note: smaller than above correlation

Fluid, T_{∞}

What is *L* in the Rayleigh number? Use a characteristic length:

$$L = \frac{A_s}{P}$$

Inclined Plates

Correlation: heated/bottom face only AND cooled/top face only

• use immersed vertical plate correlations (Churchill & Chu) but replace g in the Rayleigh number by $g\cos\theta$

Correlation: heated/top face only AND cooled/bottom face only flow is three-dimensional and no correlations exist

- Rayleigh number based on diameter of isothermal cylinder
- Churchill and Chu correlation: average Nusselt number

$$\overline{Nu}_{D} = \left[0.60 + \frac{0.387 R a_{D}^{\frac{1}{6}}}{\left(1 + \left(0.559/\text{Pr} \right)^{\frac{9}{16}} \right)^{\frac{8}{27}}} \right]^{2} \Rightarrow Ra_{D} < 10^{12}$$

D. B. Go

۲

• Sphere

- Rayleigh number based on diameter of isothermal sphere
- Churchill: average Nusselt number

$$\overline{Nu}_{D} = 2 + \frac{0.589Ra_{D}^{\frac{1}{4}}}{\left(1 + \left(0.469/\Pr\right)^{\frac{9}{16}}\right)^{\frac{4}{9}}} \Longrightarrow Ra_{D} < 10^{11}; \ \Pr \ge 0.7$$

Parallel Plates

- similar to internal forced convection, buoyancy-induced boundary layers develop on both plates
- boundary layers can merge to generate fully developed flow
 conditions in sufficiently long (L) and spaced (S) channels → otherwise
 the channel behaves as two isolated plates
- channels often considered vertical ($\theta = 0^{\circ}$) or inclined
 - inclined flows more complex and often result in three-dimensional flow

vertical plates

fully developed criteria:

$$Ra_{S}^{*}S/L$$
 or $Ra_{S}S/L < 10$

isolated plate criteria:

 $Ra_{S}^{*}S/L$ or $Ra_{S}S/L > 100$

AME 60634

Int. Heat Trans. Free Convection: Internal Flow

Parallel Plates – Vertical Channels ٠

- both semi-analytical and empirical correlations exist
- symmetry/asymmetry of boundary conditions play a factor
 - equal or unequal uniform surface temperatures or uniform heat fluxes for both plates

 C_2

2.51

2.51

 C_1

24

boundary

 $q_{s,1}'' = q_{s,2}''$

 $q_{s1}'', q_{s2}'' = 0$

Isothermal

$$\overline{Nu}_{S} = \left(\frac{q/A}{T_{s} - T_{\infty}}\right) \frac{S}{k} = \left[\frac{C_{1}}{\left(Ra_{s} S/L\right)^{2}} + \frac{C_{2}}{\left(Ra_{s} S/L\right)^{1/2}}\right]^{-1/2} \qquad \begin{array}{c|c} \text{boundary} & C_{1} & C_{2} \\ \hline T_{s,1} = T_{s,2} & 576 & 2.87 \\ \hline T_{s,1}, q_{s,2}'' = 0 & 144 & 2.87 \end{array}$$

$$Ra_{s} = \frac{g\beta(T_{1} - T_{2})S^{3}}{v\alpha}$$

Isoflux (Uniform Heat Flux)

$$Nu_{S,L} = \left(\frac{q_{s}''}{T_{s,L} - T_{\infty}}\right) \frac{S}{k} = \left[\frac{C_{1}}{Ra_{s}^{*}S/L} + \frac{C_{2}}{\left(Ra_{s}^{*}S/L\right)^{2/5}}\right]^{-1/2}$$
$$Ra_{s}^{*} = \frac{g\beta q_{s}''S^{4}}{k\nu\alpha}$$

Only empirical relations exist for most "real" geometries

Enclosures – Rectangular Cavities

 characterized by opposing walls of different temperatures with the the remaining walls insulated

fluid motion characterized by induced vortices/rotating flow

Rayleigh number a function of distance between heated walls:

$$Ra_{L} = \frac{g\beta(T_{1} - T_{2})L^{3}}{\nu\alpha} \rightarrow T_{1} > T_{2}$$

Heat transfer **across the cavity**:

$$q'' = h(T_1 - T_2)$$

Enclosures – Rectangular Cavities (Horizontal)

• heating from below: $\tau = 0^{\circ}$

 critical Rayleigh number exists below which the buoyancy forces cannot overcome the viscous forces

 $Ra_{L,c} = 1708 \rightarrow \begin{cases} Ra_L < Ra_{L,c} \rightarrow \text{no induced fluid motion} \\ Ra_L > Ra_{L,c} \rightarrow \text{induced fluid motion} \end{cases}$

 $Ra_L < Ra_{L,c}$: thermally stable – heat transfer due solely to conduction

$$\overline{Nu}_L = 1$$

 $Ra_{L,c} < Ra_L < 5 \times 10^4$: thermally unstable – heat transfer primarily due to induced fluid motion \rightarrow advection

• thermal instabilities yield regular convection pattern in the form of roll cells

$$\overline{Nu}_L = 0.069 R a_L^{\frac{1}{3}} Pr^{0.074}$$

(first approximation)

 $5 \times 10^4 < Ra_L < 7 \times 10^9$: thermally unstable turbulence $\overline{Nu}_L = 0.069 Ra_L^{\frac{1}{3}} Pr^{0.074}$

D. B. Go

Enclosures – Rectangular Cavities (Horizontal)

- Heating from above: $\tau = 180^{\circ}$
- unconditionally thermally stable heat transfer due solely to conduction

 $\overline{Nu}_L = 1$

Enclosures – Rectangular Cavities (Vertical)

 critical Rayleigh number exists below which the buoyancy forces cannot overcome the viscous forces

 $Ra_{L,c} = 10^{3} \rightarrow \begin{cases} Ra_{L} < Ra_{L,c} \rightarrow \text{no induced fluid motion} \\ Ra_{L} > Ra_{L,c} \rightarrow \text{induced fluid motion} \end{cases}$

 $Ra_L < Ra_{L,c}$: thermally stable – heat transfer due solely to conduction

$$\overline{Nu}_L = 1$$

Ra_{L,c} < Ra_L < 5×10⁴: thermally unstable – heat transfer primarily due to induced fluid motion → advection
a primary flow cell is induced – secondary cells

possible at large Rayleigh numbers

- Enclosures Rectangular Cavities (Vertical)
 - $Ra_{L,c} < Ra_L$: thermally unstable
 - Nusselt number a function of cavity geometry and fluid properties

$$\overline{N}u_{L} = 0.22 \left(\frac{\Pr Ra_{L}}{0.2 + \Pr}\right)^{0.28} \left(\frac{H}{L}\right)^{-\frac{1}{4}} \Rightarrow \begin{bmatrix} 2 < H/L < 10 \\ \Pr < 10^{5} \\ 10^{3} < Ra_{L} < 10^{10} \end{bmatrix}$$

$$\overline{N}u_{L} = 0.18 \left(\frac{\Pr Ra_{L}}{0.2 + \Pr}\right)^{0.29} \Rightarrow \begin{bmatrix} 1 < H/L < 2 \\ 10^{-3} < \Pr < 10^{5} \\ 10^{3} < Ra_{L} \Pr/(0.2 + \Pr) \end{bmatrix}$$

$$\overline{N}u_{L} = 0.42Ra_{L}^{\frac{1}{4}}\Pr^{0.012} \left(\frac{H}{L}\right)^{-0.3} \Rightarrow \begin{bmatrix} 10 < H/L < 40 \\ 1 < \Pr < 2 \times 10^{4} \\ 10^{4} < Ra_{L} < 10^{7} \end{bmatrix}$$

$$\overline{N}u_{L} = 0.046Ra_{L}^{\frac{1}{3}} \Rightarrow \begin{bmatrix} 1 < H/L < 40 \\ 1 < \Pr < 20 \\ 10^{6} < Ra_{L} < 10^{9} \end{bmatrix}$$

- Enclosures Annular Cavities
 - Concentric Cylinders
 - heat transfer across cavity

$$q' = \frac{2\pi k_{eff}}{\ln(D_o/D_i)} (T_i - T_o)$$

• k_{eff} is effective thermal conductivity \rightarrow thermal conductivity a stationary fluid would need to transfer the same amount of heat as a moving fluid

$$Ra_{c}^{*} < 100 \Rightarrow \frac{k_{eff}}{k} = 1$$

100 < $Ra_{c}^{*} < 10^{7} \Rightarrow \frac{k_{eff}}{k} = 0.386 \left(\frac{\Pr}{0.861 + \Pr}\right)^{\frac{1}{4}} \left(Ra_{c}^{*}\right)^{\frac{1}{4}}$

• Critical Rayleigh number:
$$Ra_c^* = \frac{\left[\ln(D_o/D_i)\right]^4}{L^3\left(D_i^{-3/5} + D_o^{-3/5}\right)}Ra_L \rightarrow L \equiv (D_o - D_i)/2$$

- Enclosures Annular Cavities
 - Concentric Spheres
 - heat transfer across cavity

$$q = \frac{\pi k_{eff} D_i D_o}{L} \left(T_i - T_o \right)$$

• *k_{eff}* is **effective thermal conductivity** → *thermal conductivity a stationary fluid should have to transfer the* **same amount of heat** *as a moving fluid*

$$Ra_{s}^{*} < 100 \Rightarrow \frac{k_{eff}}{k} = 1$$

100 < $Ra_{s}^{*} < 10^{4} \Rightarrow \frac{k_{eff}}{k} = 0.74 \left(\frac{\Pr}{0.861 + \Pr}\right)^{\frac{1}{4}} \left(Ra_{s}^{*}\right)^{\frac{1}{4}}$

• Critical Rayleigh number:
$$Ra_s^* = \frac{LRa_L}{\left(D_o/D_i\right)^4 \left(D_i^{-\frac{7}{5}} + D_o^{-\frac{7}{5}}\right)^5} \rightarrow L \equiv \left(D_o - D_i\right)/2$$
