

# Definition specifics on formation pressure (Pe) and productivity index (PI)

Despite of terminological similarity there is a difference in the way [Dynamic Modelling \(DM\)](#), [Well Flow Performance \(WFP\)](#) and [Well Testing \(WT\)](#) usually define [formation pressure](#) and [productivity index](#).

The most typical definitions (although they do not cover the full variety of definitions referred in petroleum literature) are summarised in the table below:

|     | Formation pressure, $p_e$                                                                                                                                                                                                                                                                                     | Flowrate, $q$                                                                                                                                                                                                                                                                                      | Productivity Index, $J$                                                                         |

|           |                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                    |                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>DM</b> | <p>9-cell formation pressure</p> $(3) \quad p_{e9, i, j} = \frac{1}{9} \sum_{k=i-1}^{i+1} \sum_{l=j-1}^{j+1} p_{k, l}$ $(4) \quad p_{e9, i, j} = \frac{1}{9} (p_{i, j} + p_{i, j+1} + p_{i, j-1} + p_{i-1, j} + p_{i-1, j+1} + p_{i-1, j-1} + p_{i+1, j+1} + p_{i-1, j+1} + p_{i+1, j-1})$ <p>for each fluid phase individually: <math>p_{e9, o}, p_{e9, g}, p_{e9, w}</math></p> | <p>Sandface Flowrates:</p> <p>Oil sandface flowrate<br/><math>q_o</math></p> <p>Gas sandface flowrate<br/><math>q_g</math></p> <p>Water sandface flowrate<br/><math>q_w</math></p> | <p>Sand Prodi</p> |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|

Sometimes the wrong estimations of flowrate stem form the wrong inputs (  $J$  or  $p_e$  ).
