

Water surface flowrate = q_W

Volumetric flowrate of water measured at SPE Standard Conditions (STP).

Usually produced from water phase only.

For MBO fluid @model the water surface flowrate q_W is related to water sandface flowrate q_w as (see derivation):

$$(1) \quad q_W^\uparrow = \frac{q_w}{B_w}$$

where

B_w formation volume factors between separator and sandface pressure/temperature conditions

It relates to Liquid production rate at surface as:

$$(2) \quad q_W^\uparrow = Y_W q_L^\uparrow$$
