

# Numerical Production Forecast

Predicting the future production dynamics for a given well, group of wells or the whole field based on [Dynamic Flow Model \(DFM\)](#).

It provides [formation pressure](#) alongside.

The predicted properties depend on the selected [Well control](#) along the following diagram:

|                    | Pressure Control                                                                                                                                                                             | Liquid Control                                                                                                                                                                       |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input property     | <ul style="list-style-type: none"><li>• <a href="#">BHP</a></li></ul>                                                                                                                        | <ul style="list-style-type: none"><li>• <a href="#">Liquid rate</a></li></ul>                                                                                                        |
| Predicted property | <ul style="list-style-type: none"><li>• <a href="#">Liquid rate</a></li><li>• <a href="#">Formation pressure</a></li><li>• <a href="#">Water cut</a></li><li>• <a href="#">GOR</a></li></ul> | <ul style="list-style-type: none"><li>• <a href="#">BHP</a></li><li>• <a href="#">Formation pressure</a></li><li>• <a href="#">Water cut</a></li><li>• <a href="#">GOR</a></li></ul> |

The [Oil Control](#) is used in [history matching](#) but never is used for [Numerical Production Forecast](#).

The choice between [Pressure Control](#) and [Liquid Control](#) is subject to [Lift mechanism](#) and specific [Lift](#) settings.
