

Thermoanemometer

@wikipedia

A device measuring the difference between the incoming fluid flow temperature and the temperature of artificially heated fluid (see **Fig. 1**).

blocked URL

Fig. 1. Thermoanemometer sensor schematic .

Mathematical Model

The temperature difference is related to thermal properties of fluid ($\{\lambda, a, \nu\}$) and flow velocity u :

$$(1) \quad \Delta T = \frac{q r}{\lambda} \frac{1}{Nu}$$

The calibration plot is usually set in $\left\{ \frac{1}{\Delta T}, Nu \right\}$ coordinates or in case of a small velocity range in $\left\{ \frac{1}{\Delta T}, u \right\}$ coordinates.
