

Incompressible fluid

The [fluid](#) which which [density](#) is not dependent on [pressure](#) p :

$$(1) \quad \rho(T, p) = \rho_0(T) = \text{const}$$

which is equivalent to zero [compressibility](#):

$$(2) \quad c(T, p) \equiv 0 \Leftrightarrow \frac{d\rho}{dp} = 0$$

where

T	Temperature
-----	-----------------------------

It is opposite to [Compressible Fluid](#) which [density](#) depends on [pressure](#).

[Incompressible fluid](#) does not exist but in many practical applications the [pressure](#) variation may stay within the sufficiently narrow range where a [fluid](#) can be considered as [incompressible](#).

The concept of [Incompressible fluid](#) should not be confused with [Incompressible flow](#). The latter can develop even for [compressible fluid](#).
