

Incompressible matter

The [matter](#) which [density](#) is not dependent on [pressure](#) p :

$$(1) \quad \rho(p, T) = \rho_0(T) = \text{const}$$

which is equivalent to zero [compressibility](#):

$$(2) \quad c(T, p) \equiv 0 \Leftrightarrow \frac{d\rho}{dp} = 0$$

where

[T](#) [Temperature](#)

[Incompressible matter](#) does not exist but in many practical applications the [pressure](#) variation may stay within the sufficiently narrow range where a given [matter](#) can be considered as [incompressible](#).
