

Mass Flux

@wikipedia

Amount of **fluid mass** passing through a unit **area** per unit time:

$$j_m = \frac{\delta m}{\delta A \delta t}$$

where

δm	the amount of mass passed through the area δA during the time δt
------------	--

SI unit	Metric unit	Oilfield units
$\text{kg} / (\text{s} \cdot \text{m}^2)$	$\text{kg} / (\text{s} \cdot \text{m}^2)$	$\text{lb} / (\text{s} \cdot \text{ft}^2)$

Mass Flux vector is proportional to fluid density ρ and fluid velocity \mathbf{u} :

$$(1) \quad \mathbf{j}_m = \rho \mathbf{u}$$
