

Dimensionless Heat Transfer Numbers

The table below shows the list of the popular dimensionless numbers related to heat transfer.

Nusselt Number	$\text{Nu} = \frac{U \cdot L}{\lambda}$	characterizes heat exchange rate with fluid convection
Biot Number	$\text{Bi} = \frac{U \cdot L}{\lambda}$	characterizes heat exchange rate with solid bodies
Prandtl number	$\text{Pr} = \frac{\nu}{a}$	characterizes fluid in terms of its ability to develop heat convection against heat conduction
Grashof number	$\text{Gr} = \frac{g \beta \Delta T L^3}{\nu^2}$	characterizes the natural heat convection due to gravity
Rayleigh number	$\text{Ra} = \text{Gr} \cdot \text{Pr}$	characterizes the natural heat convection due to gravity
Fourier number	$\text{Fo} = \frac{a \cdot t}{L^2}$	dimensionless time
