

Isentropic bulk modulus = K_S

Bulk modulus under isentropic (constant entropy $S = \text{const}$) compression/decompression thermodynamic process:

$$(1) \quad K_S = \rho \cdot \left(\frac{\partial p}{\partial \rho} \right)_S$$

Isentropic bulk modulus is material property and is inverse to Isentropic Compressibility β_S :

$$(2) \quad K_S = \frac{1}{\beta_S}$$
