

# System Model

@wikipedia

Description of a [System](#) behavior in response to the parameters to which the system is sensitive to (see [Fig. 1](#)).

Modern [Models](#) are usually implemented in the form of a computer software which provides interface to:

It normally follows the [Model Description Protocol](#):

<b>Motivation</b>	Explains the reasons why a <a href="#">Model</a> may come in need
<b>Inputs</b>	A list of <a href="#">System properties</a> which <a href="#">Model</a> takes as input
<b>Outputs</b>	A list of <a href="#">System properties</a> which <a href="#">Model</a> simulates based on the <a href="#">Model Inputs</a>
<b>Model Proposition</b>	A list of assumptions/constraints which have been put into the <a href="#">Model</a>
<b>Model Mathematics</b>	Definition of the <a href="#">Model</a> using <a href="#">mathematical</a> concepts and <a href="#">mathematical language</a>
<b>Model Solver</b>	Description of the solution algorithm to the <a href="#">Mathematical Model</a>
<b>Approximations</b>	Simplified <a href="#">solver(s)</a> for rough estimations and fast track analysis of a <a href="#">System</a> 's behavior
<b>Model Matching</b>	Description of algorithm of matching the <a href="#">Model</a> to the training data
<b>Applications</b>	A list of popular <a href="#">Model</a> applications and limitations
<b>Examples (Cases)</b>	A list of practical cases showing <a href="#">Model</a> functionality and usefulness and limitations

A [System](#) may have many [Models](#) depending on which [System properties](#) are taken as [Model Inputs](#) and [Model Outputs](#).

The [Model](#) may have some governing properties which can be trained to make [Model](#) output fit the experimental data.

The results of the training should be qualified by means of [Model Validation](#).
